BUSINESS PROCESS MAPPING

QuickService Delivery

Order Management Process | Case Study

Prepared by Rodrigo Garza García

Project overview

This case study maps the order management process of QuickService Delivery, a customer service company specializing in food and grocery delivery. The objective is to visualize the workflow from order placement to final fulfillment, clarify responsibilities across departments, and identify decision points that influence process execution.

PROCESS START	PROCESS END	PARTICIPANTS
Customer places an order	Order is collected or delivered	Customer + four departments

Process scope and objective

The process begins when a customer submits an order and provides the required details. It covers order validation, payment, preparation, and fulfillment through customer pickup or home delivery. The model focuses on the handoffs between Customer, Customer Service, Sales, Production, and Warehouse.

Task 1 | Process stages and responsibilities

Stage	Responsible area	Key activities	Decision / control
1. Order placement	Customer Service	Receive and record customer details, requested items and quantities, special instructions, and fulfillment preference.	Is the order complete?
2. Payment process	Sales	Provide payment options, verify payment receipt, update payment status, and notify the customer.	Has payment been received?
3. Order preparation	Production	Prepare the order according to customer requirements and check accuracy, completeness, and readiness.	Is the order ready for fulfillment?
4. Delivery	Warehouse	Prepare the order for pickup or schedule and dispatch home delivery; notify the customer and confirm handover.	Pickup or home delivery?

Task 2 | Key process components

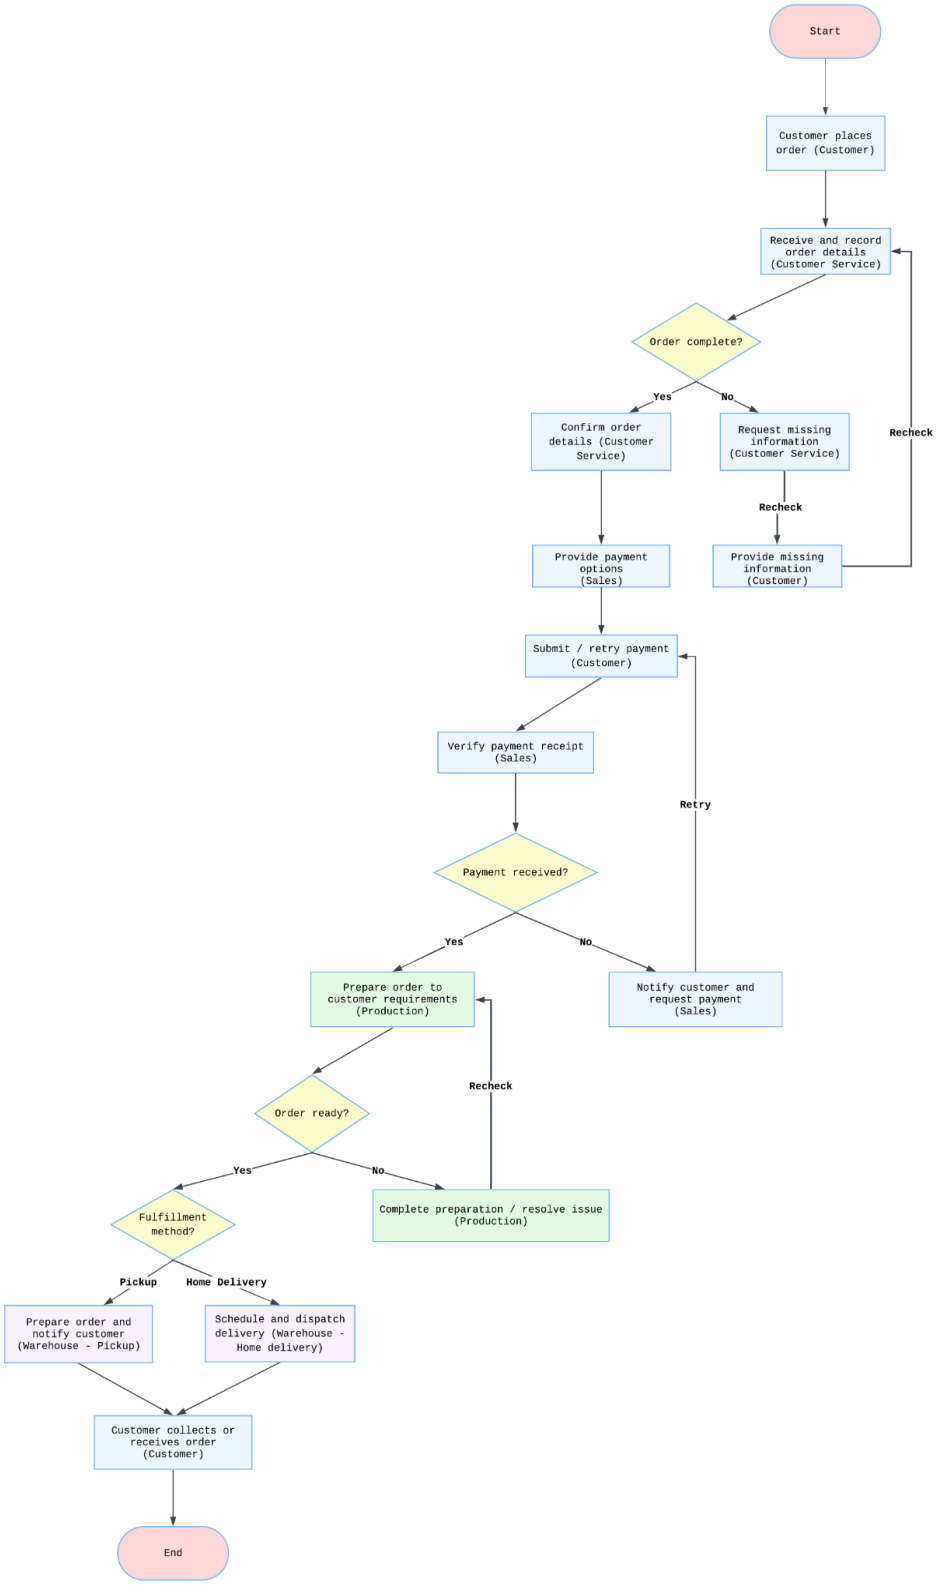

Component	Description	Application in this process
Participants / swimlanes	People or departments responsible for activities.	Customer, Customer Service, Sales, Production, Warehouse.
Activities	Tasks performed to move the order forward.	Record order, verify payment, prepare items, arrange fulfillment.
Decision points	Conditions that determine which path the process follows.	Order completeness, payment receipt, order readiness, fulfillment method.
Sequence flows	Connections showing the order and direction of activities.	The flow from order placement through final handover.
Outputs	The result produced by a process stage.	Validated order, confirmed payment, prepared order, completed fulfillment.

Decision logic and modeling assumptions

- Incomplete order: Customer Service requests missing information and validates the order again.
- Payment not received: Sales follows up with the customer; after payment is submitted or retried, payment is verified again.
- Order not ready: Production completes the remaining preparation or resolves the issue before checking readiness again.
- Fulfillment method: The customer's pickup or home-delivery preference is captured during order placement and followed by Warehouse.
- Process completion: The workflow ends when the customer collects the order or receipt of the home delivery is confirmed.

Modeling note: *The exception paths are explicit modeling assumptions added to make the workflow analyzable. The course scenario does not specify a payment cancellation policy or detailed exception-handling rules.*

TASK 3 | PROCESS FLOWCHART

The flowchart shows the sequence of activities, responsible participants, decision points, and exception paths from order placement through final fulfillment.
